i-7000 "Self Tuner" Innovative Design SERIES

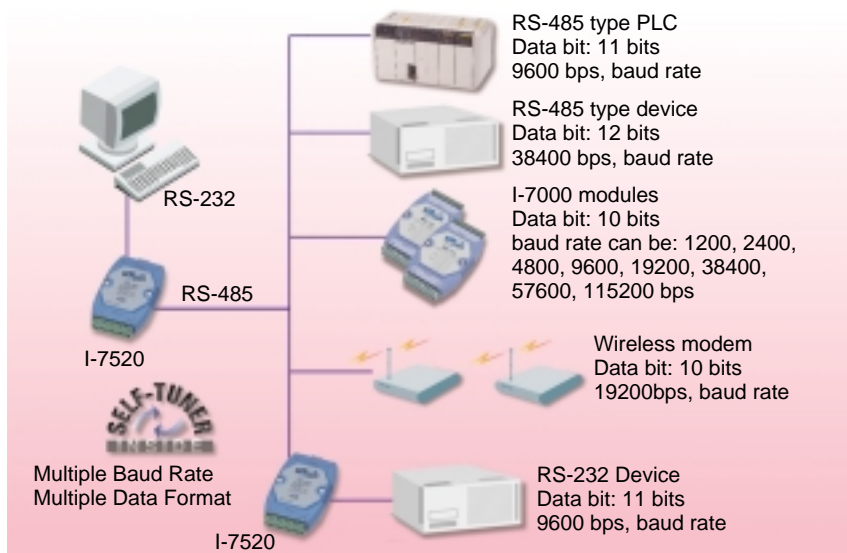

"Self Tuner" A New Technology You Should Know !

U.S. Patent Pending,
R.O.C. PAT No. 086674
R.O.C. PAT No. 132457

Self Tuner Chip

Conventional RS-232 to RS-485 converter uses the DIP switch to choose the baud rate and data format for the whole RS-485 network. All modules, devices and equipment in the whole network should be configured to the same baud rate and data format. Unfortunately most real world applications can't be implemented in such a simple way. "Self Tuner" is an innovative chip and designed for solving this problem. Every converter contains a "Self Tuner" chip. This chip can auto-tune the baud rate and data format in the whole network. Therefore I-7520 can connect to different baud rate and different data format devices in the same network.

i-7000 "Self Tuner" Innovative Design SERIES

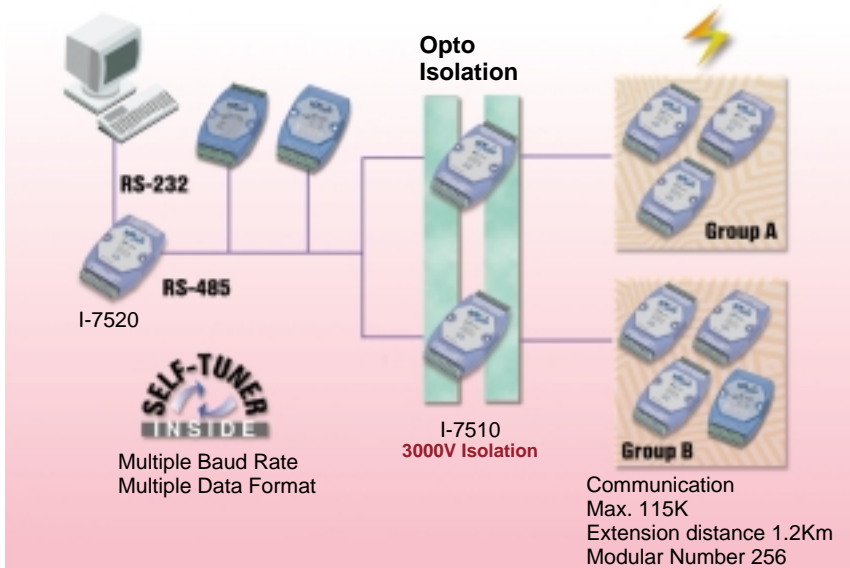

High Speed & High Quality Isolated RS-485 Repeater

**Drop the low-end Repeater,
Save your RS-485 Network**

Self Tuner Chip

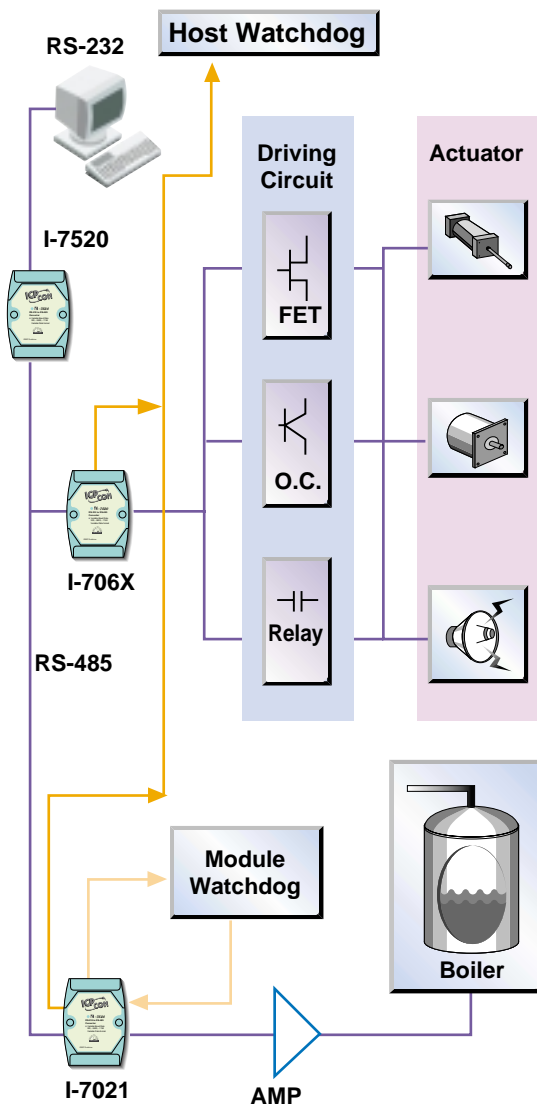

Conventional RS-485 repeater uses the DIP switch to choose the baud rate and data format for the whole RS-485 network. Our repeater contains an innovative "Self Tuner" chip. This chip auto-tune the baud rate and the data format in the whole network and make the whole network very stable. Because the superior designs, every repeater can extend the communication to another 1.2 Km at the 115K speed. If the speed is lower than 115k, the extended distance can be up to 2.1 Km or 3.4Km. Some low-end repeaters can't repeat signal well and cause the whole network unstable. Those low-end repeaters don't have isolation. The whole network could be destroyed by lighting or transient high voltage. If your RS-485 is unstable, please change the converter and repeater.

i-7000 "Dual Watchdog" SERIES

Network Control Made Reliable

Active host watchdog

Output state go to safe state: L

Active host watchdog

Output state go to safe state: H

Active host watchdog

D/A output go to safe state

Why! "Dual Watchdog"

Some company's remote I/O modules doesn't have the "Dual Watchdog", it may cause unrecoverable damage to the whole control system.

What is "Dual Watchdog"

I-7000 Provides Module and Host Watchdog. The Module Watchdog is a hardware watchdog. The Host watchdog is a software watchdog. The module watchdog is designed to automatically reset the μp when the module fails. The host watchdog monitors the host controller (PC or PLC). The output of module can go to the safe state, if the host fails.

Example 1

When the host watchdog active, the output of Digital I/O should go to the safe state, logical high or low. The user can specify the logical state.

Example 2

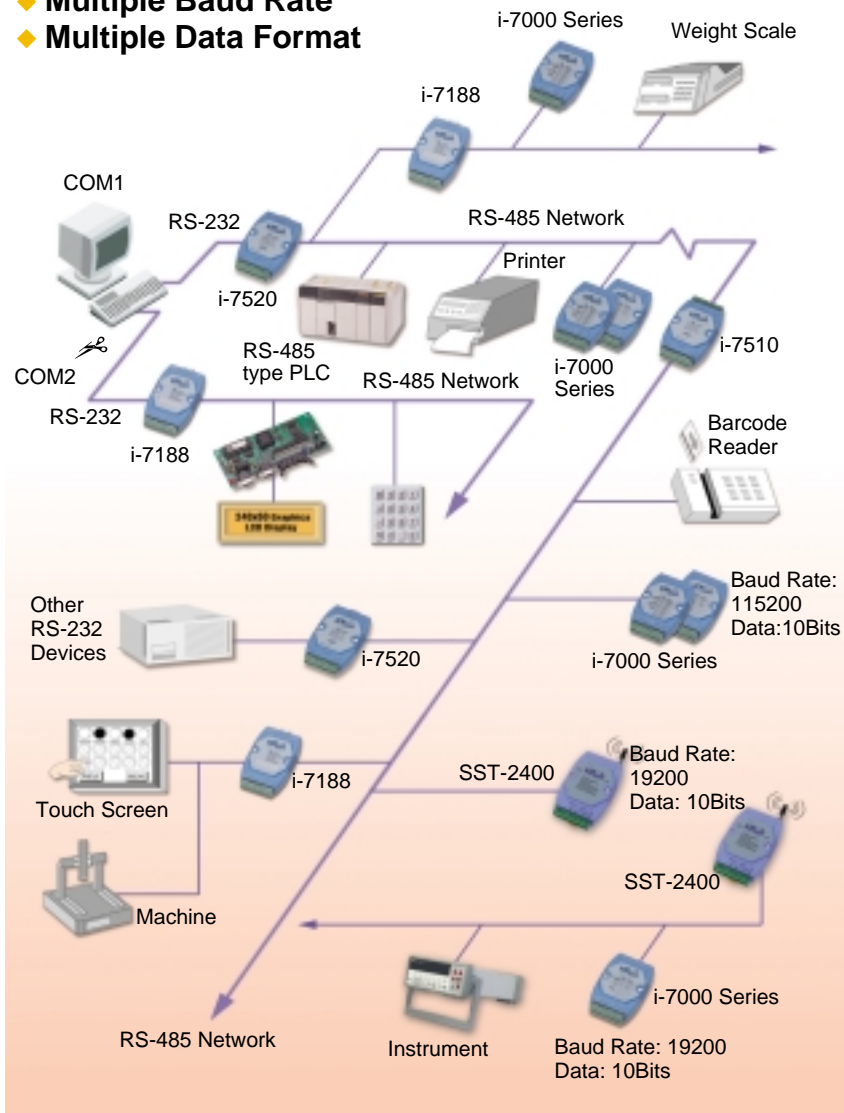

When the host watchdog active, the output of D/A is stepped until the final (safe) value is reached and a gradual controlled output slew rate is followed. The user can specify the slew rate of the output voltage.
