Q1: Both tM-7565 and I-7565-H1/H2 are USB to CAN converters. What are the main differences? How should users choose? (2022/11/29, Bao)

A: The main differences between tM-7565 and I-7565-H1/H2 are the following two items, which can be selected according to application requirements:

I. USB baud rate:

The USB baud rate of tM-7565 supports 110~230.4kbps, while the USB baud rate of I-7565-H1/H2 supports 12Mbps. Therefore, tM-7565 is suitable for general applications, while I-7565-H1/H2 are suitable for high-speed applications.

Q2: After installing the VxCAN Utility on the computer, the tM-7565 USB driver should have been installed, but why the VxCAN Utility still cannot find the tM-7565? (2022/11/29, Bao)

A: When VxCAN Utility is installed, the USB driver of tM-7565 is not included, so please go to the product web page to download and install the USB driver of tM-7565 first, and after the device administrator confirms that the COM port has been virtualized, then search this COM port in VxCAN Utility. The image shows two screenshots. The left screenshot is from the ICP DAS website's 'Download Center' for the tM-7565 product. It lists a file named 'tM-7565 Linux Install Manual (EN)' and a 'USB Driver' file. The right screenshot shows the Windows Device Manager 'Ports (COM & LPT)' section, where the 'ICPDAS tM-7565 USB-To-CAN Converter (COM3)' is highlighted with a red box, indicating it has been successfully installed and recognized as a COM port.

Q3: What is Listen only mode? Which modules of the CAN converter support this mode? (2022/11/29, Bao)

A3: This mode is mainly to simply monitor the message of the CAN network without converting the message, so it will not send any CAN message to the CAN network, such as Error Frame or ACK signal. And this mode only supports tM-7530, tM-7530A and tM-7565. (2022/11/29, Bao)
