Q: How do I access multiple Modbus TCP Slave devices from a single Modbus RTU/ASCII Master device?

A:

When connecting multiple tGW-700 modules in an RS-485 network, the **Virtual ID Range** for a COM port on the tGW-700 can be used to access a specific Modbus TCP slave device within limit range. The following is a detailed description of the **Virtual ID Range** and **Virtual ID Offset** mapping configuration for the tGW-725 module:

Step 1: Confirm that both the Ethernet connection and the tGW-700 series module are functioning correctly. For detailed information regarding how to install, configure and operate your tGW-700 series module, refer to the tGW-700 Quick Start Guide, which can be downloaded from:

Buttons: Search Server, Configuration (UDP), Web, Exit

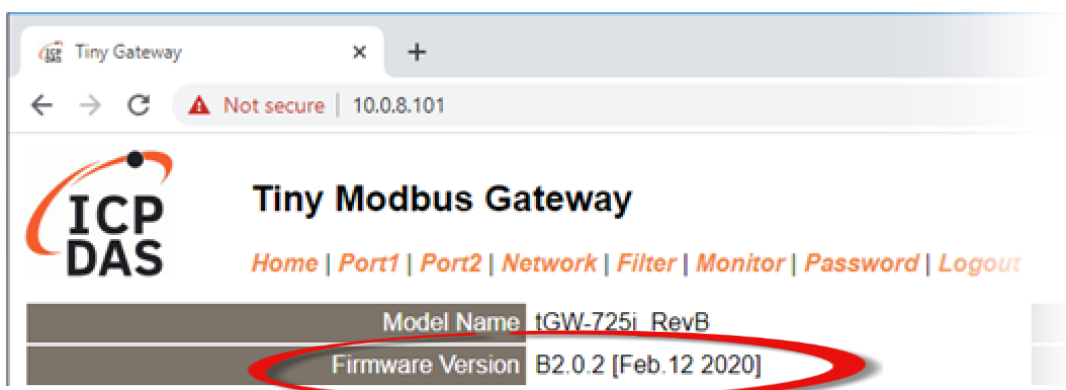

Step 2: Execute the eSearch Utility to search for any tGW-700 modules connected to the network, and then click the name of the tGW-700 module to select it.

Step 3: Click the “Web” button to log in to the web configuration pages for the tGW-700 module (use the default password “admin”), or enter the URL address of the tGW-700 in the address bar of the browser.

Step 4: Check that the firmware version for the module is **v2.0.1 [Jan. 16, 2020] or later**. Note that if your firmware version is earlier than v2.0.1 [Jan. 16, 2020], the firmware must first be updated to the latest version. For detailed information regarding the firmware update process, refer to the tGW700 firmware update documentation, which can be downloaded from:

Step 5: Click the “Port1” tab to display the Port1 Settings page

Step 6: Select the appropriate Baud Rate, Data Format and Modbus Protocol settings from the relevant drop down options. The following is an example: Baud Rate (bps) “9600”, Data Size (bits) “8”, Parity “None”, Stop Bits (bits) “1” and Modbus Protocol “Modbus RTU”.

Step 7: In the Modbus Settings area for Port1, enter the Virtual ID Range and Virtual ID Offset settings. The following is an example: Virtual ID Range “7 to 7” 、Virtual ID Offset “-6”。

(RTU ID = 7 , TCP Slave ID = 7 - 6 = 1)

Modbus Settings	Current	Updated	Comment
Slave Timeout	300	300	10 - 65000 ms (step 10), Default: 300

Virtual ID Range	1 - 247	7 to 7	Range: 1 to 247. Note: Gateway skips the Modbus messages if its ID is NOT in the specified range. Offset: -246 to 246, No change=0. For example: Virtual ID = 1 to 10, offset = 10, then physical Slave ID = 11 to 20. Virtual ID = 31 to 40, offset = -10, then physical Slave ID = 21 to 30.
Virtual ID Offset	0	-6	

Step 8: In the Pair-connection settings area for Port1, check that the configuration details are same as those shown in the table below:

Field	Application Mode	Network Protocol	Remote Server IP	Remote TCP Port
Pair-connection Settings	Client	TCP	10.0.8.28	502
		Modbus Protocol, IP address, TCP port for the Modbus TCP Slave device.		

Step 9: Amend any details as required and then click the “Submit” button to complete the configuration.

Step 11: Click the “Port2” tab to display the Port2 Settings page.

Step 12: Select the appropriate Baud Rate, Data Format and Modbus Protocol settings from the relevant drop down options. The following is an example: Baud Rate (bps) “9600”, Data Size (bits) “8”, Parity “None”, Stop Bits (bits) “1” and Modbus Protocol “Modbus RTU”.

✂ Refer to **Steps 5 to 6** for an illustration of how to perform the above procedure.

Step 13: In the Modbus Settings area for Port2, enter the Virtual ID Range and Virtual ID Offset settings. The following is an example: Virtual ID Range “6 to 6” 、Virtual ID Offset “-5” 。

(RTU ID = 6 , TCP Slave ID = 6 - 5 = 1)

Modbus Settings	Current	Updated	Comment
